In algebra, a division ring, also called a skew field, is a ring in which division is possible. Specifically, it is a nonzero ring in which every nonzero element  $a$  has a multiplicative inverse, that is, an element generally denoted  $a^{-1}$ , such that  $a a^{-1} = a^{-1} a = 1$ . So, division may be defined as  $a / b = a b^{-1}$ , but this notation is generally avoided, as one may have  $a b^{-1} \neq b^{-1} a$  ...

Lebesgue measure • page two That is, every subset of  $\mathbb{R}$  has Lebesgue outer measure which satisfies properties (1)–(3), but satisfies only part of property (4). Examples of disjoint sets  $A$  and  $B$  for which  $\mu^*(A \cup B) \neq \mu^*(A) + \mu^*(B)$  seem at first a bit bizarre. Such an example is given below.
