On The Occurrence Of Phosphorite

Phosphorite, phosphate rock or rock phosphate is a non-detrital sedimentary rock that contains high amounts of phosphate minerals. The phosphate content of phosphorite (or grade of phosphate rock) varies greatly, from 4% to 20% phosphorus pentoxide (P₂O₅). Marketed phosphate rock is enriched ("beneficiated") to at least 28%, often more than 30% P₂O₅.

7.3.2 Phosphorite. Phosphorite also occurs in lenses in sediments off the coasts of the Chinese mainland and the Korean Peninsula (Ludwig & Valencia, 1993). The Yellow River delta extends along more than 100 km of the coast, and river sediment can be traced all the way out to the edge of the continental shelf.

Phosphorite - an overview | ScienceDirect Topics

Phosphorite formation seems to be connected with oceanic upwelling, but estuarine areas are another possible site. The high Mg-content of sea water seems to restrict phosphate precipitation at the present time to diagenetic processes within the sediments. Here, pH has to be relatively low and Eh strongly negative, but the optimal values are unknown.

The phosphorite contains anomalously high levels of Zn (>5000 mg kg⁻¹), Cd (>1.1%), Ag (>20 mg kg⁻¹), Be (>80 mg kg⁻¹) and, to a lesser extent, U. Textural and geochemical evidence indicates that the phosphorite concretions were most likely formed by the replacement of limestone by secondary deposition proximal to fossil guano deposits, postulated to be Late Miocene or Pliocene sea-bird colonies.
